

Starting your development for dprevived.com

Docker Install

Install Docker (outdated)

docs.docker.com/get-docker/ or docs.docker.com/engine/install/

Comment: Only plain Docker needed. Docker Desktop is optional.

use `docker-compose.yml`

Install git client

- Windows <https://git-scm.com/download/win>
- Linux use Packtmanager of distribution
- MacOS already included

Or look at <https://github.com/git-guides/install-git>

Install Misago

- *`git clone https://github.com/rafalp/misago.git`*
- *`cd misago`*
- *`npm install`*
- *`./dev init`*

Install dprevived version

- move overwrite-xx.zip into basefolder and extract it to overwrite some files
- start misago via:
`docker compose up --detach`
or via docker desktop
- enter misago docker container via:
`docker compose exec misago /bin/bash`
or via docker desktop
- import dprevived striped database via: (This is one long line!)
`bzcat dev-database-2023-04-14.sql.bz2 | PGPASSWORD=$POSTGRES_PASSWORD psql -U \`
`$POSTGRES_USER -h $POSTGRES_HOST $POSTGRES_USER`
- start migration:
`python manage.py migrate`
- exit docker container:
`exit`

start browser on <http://127.0.0.1:8000>

You should see the Homepage
Enter Admin: `http://127.0.0.1:8000/admincp`
User: root
Password: superuser

Now you are done.

Infos about docker for console users:

Starting / stopping misago container:

Start: ***docker compose up***

Stop: press ctrl-c

or

Start: ***docker-compose up --detach***

Stop: ***docker compose down***

list all running container:

docker ps

enter shell inside docker misago container

docker compose exec misago /bin/bash

Manage misago

./dev

Manage Django

./dev manage.py

Native Install

you need

- **git**
- **postgres**
- **python 3.12**
- **npm**
- **bzip2**
- **tar**
- **virtualenv**

Make a new virtualenv dir

`mkdir devel39`

`virtualenv --python=/usr/local/bin/python3.12 devel39`

Activate with

`cd devel39/`

`. bin/activate`

Get git

```
git clone -b dpdevl39 https://github.com/neo-photo/Misago-dprevived.git  
cd Misago-dprevived
```

Create postgres database

(do as you like with gui or “create database [database]” in psql)

unpack dev-database-2023-04-14.sql.bz2

```
bunzip dev-database-2023-04-14.sql.bz2
```

Import database

```
PGPASSWORD=[PASSWORD] pg_restore -h 127.0.0.1 -U [user] --no-owner --no-acl --clean --if-exists -Fc -d [database] dev-database-2023-04-14.sql
```

Install python libs

```
pip3.12 install -r requirements.txt  
(optional if install or migration fails try)  
pip3.12 install celery -U  
pip3.12 install gunicorn  
python3.12 manage.py migrate
```

start server

```
python3.12 manage.py runserver
```

Start browser

Changing layout

- you can add a new css in the backoffice and overwrite styles
- you can copy any file from misago/templates/misago to plugin4pdrevived/tempates/misago
- you can include css or js inside plugin4pdrevived/tempates/misago/jumbotron.html to run js on startup use ready() see jumbotron.html

If you want to check the layout of components redereed by react.js you shoud deativate the component in frontend/src/initializers

Changing react.js

- cd into frontend folder
- ***npm install***
- ***webpack --watch --progress***

customise frontend files

deploy

- ***npm run build***
- zip misago/static folder

see: <https://misago-project.org/t/html-customization-guide/1197/#post-5760>

Native install:

Needs:

Python3.x

Pip 3.x

virtualenv

Postgress

1. create enviroment: (virtualenv devel)
2. enter dir and unzip files (cd devel; unzip path_to_zip/name_of_zip.zip)
3. activate virtualenv (. /bin/activate)
4. Install requirements (pip3 install -r dprevived-requirements.txt)
5. Install or patch database
6. extract all three tar.gz files (tar xzf _filename_.tar.gz)
7. change sesstings/settings.py to meet your local settings database, dir structure, etc
8. install frontend (cd frontend;npm install)
9. start fronted developing (npm rum start)
10. start django in other shell dont forget to activate virtualenv (python3 manager.py runserver)

```
git clone -b 0.39.2 --single-branch https://github.com/rafalp/Misago.git
Misagoxx
```

make new env

```
python3 -m venv ./
```

```
pip3 install pylibmc
```

```
pip3 install -r requirements.in
```

```
pg_restore -U spirito -h 127.0.0.1 -vx0W --role spirito -d misago40
dprevived-2024-04-28.sql
```

```
python3.12 manage.py migrate
```

```
python3.12 manage.py runserver
```
